USER REQUIREMENTS: *Windows 2000 *Windows XP *Windows Vista *Windows 7 *Windows 8 *Windows 10 *Note:**The mobile version of BMDb does not include the many user interface (UI) features available in the PC edition version. However, some UI features available on Android and iOS can not be used on the mobile edition. **Note:**The application includes an Explorer-like interface. Tissue-specific regulation of the interferon-inducible, 2'-5'-oligoadenylate synthetase (OAS) gene family. The mammalian 2'-5'-oligoadenylate synthetase (OAS) gene family is rapidly induced following interferon (IFN) treatment. The human OAS genes have been divided into seven groups, designated OAS1-7. Different OAS gene groups exhibit a distinct pattern of expression in several cell types, and their expression is influenced by the type of IFN species. Moreover, different OAS gene groups exhibit similar tissue-specific expression patterns, particularly in the gastrointestinal tract and in B cells. Promoter analysis demonstrated that individual OAS gene groups share specific cis-acting elements. In addition to IFN, OAS gene expression was also induced following other types of stimulations, including mitogen stimulation and bacterial infection. OAS gene expression is regulated in response to various physiological conditions by different mechanisms. In this review, we describe the

current knowledge about the mechanisms involved in the regulation of the OAS gene family.
